

This analysis explores the prevalence of child labour across different regions, genders, age groups, and years to identify the most vulnerable populations and evaluate trends over time. The goal is to support policymakers in targeting interventions where they are needed most."

This dataset can answer questions like:

- Which regions have the highest child labour?
- Has child labour increased or decreased over time?
- Are boys or girls more affected?
- Which age groups are most vulnerable?
- Which regions need the most intervention?

DAX Code

1. Average Child Labour % =
`DIVIDE(CALCULATE(AVERAGE('ChildLabourData'[child_labour_percentage]),
'ChildLabourData'[sex] = "Total"), 100)`
2. Female Rate % =
`DIVIDE(CALCULATE(AVERAGE('ChildLabourData'[child_labour_percentage]),'ChildLabourData'[sex] = "Female"),100)`
3. Male Rate % =
`DIVIDE(CALCULATE(AVERAGE('ChildLabourData'[child_labour_percentage]),'ChildLabourData'[sex] = "Male"),100)`
4. Gender Disparity Gap =
`[Male Rate %] - [Female Rate %]`
5. Most Affected Age Group =
`TOPN(1, VALUES('ChildLabourData'[age_group]), CALCULATE(
AVERAGE('ChildLabourData'[child_labour_percentage]), 'ChildLabourData'[sex] =
"Total"), DESC)`
6. Max Regional Child Labour % =
`DIVIDE(MAXX(VALUES('ChildLabourData'[geographic_area]), CALCULATE(
AVERAGE('ChildLabourData'[child_labour_percentage]), 'ChildLabourData'[sex] =
"Total")), 100)`

Analysis Results

1. What is the average child labour percentage worldwide? **(KPI)**

On average, 12.20% of children are engaged in child labour.

2. Which regions have the highest child labour? **(Horizontal bar chart)**

Burundi records the highest average child labour, suggesting stronger intervention is needed.

3. Which regions have the lowest child labour?

Russian Federation has zero and North America (UNICEF rep.region) has significantly lower child labour.

The Russian Federation records the lowest reported child labour percentage at 0%, while North America (UNICEF rep. region) also reports relatively low levels. These results may reflect lower prevalence, differences in socioeconomic conditions and policy environments, or differences in data collection and reporting. Further investigation would be needed before attributing the differences to policy success alone.

4. Has child labour improved over time? **(LINE CHART)**

The average child labour percentage showed a steady decline from 2020 to 2023, suggesting improvements in child protection efforts or school attendance. However, there was a slight increase in 2024, which could be associated with economic challenges, increased poverty, conflicts, or disruptions that forced more children into work. Additional data would be required to determine the exact cause.

5. Male vs Female **(bar Chart)**

Males experience slightly higher child labour rates than females.

6. Which age group is most affected?

Children aged 5–17 experience the highest rates of child labour.

7. Top 10 countries/regions highest child labour **(Table or Bar chart)**

Burundi records the highest child labour rate, while Madagascar ranks tenth among the countries analyzed.

8. What is the Trend by gender (MULTI Line Chart)

Although child labour declined for both genders over time, males consistently recorded slightly higher rates than females.

Recommendations

- Prioritize intervention programs in countries with the highest child labour rates, particularly Burundi and other high-risk regions.
- Strengthen education access and poverty reduction initiatives for children aged 5–17.
- Continue monitoring yearly trends to identify emerging increases, such as the slight rise observed in 2024.
- Develop targeted programmes for boys while ensuring both genders receive equal protection.
